The first modular raised floor heating

The first modular raised floor heating, with removable panels.

The possibility of inspecting any component of the installation is combined with the greatest comfort of a panel heating.

This kind of modular raised floor heats any room through a low temperature system installed in every module

Electrical and network cables can be easily reached in the hollow space of the flooring.

The full working of the system is very fast due to the small thickness of the heating module, which gives more flexibility to its functions.

With the new modular raised floor heating, it is possible to match the expectations of flexibility and the quality of the office life.

Planium srl, manufacturer of modular flooring surfaces and personalised solutions for architectural and contract design, has developed with Eurotherm spa, leading company in raised floor heating systems, the new modular raised floor heating system.
